Mary Grace Dashboard · Computation & Data Source Guide

Nov 6, 2026 · @Wil

1. Data source

Every number in the dashboard comes from OMG (Mary Grace POS data, read-only), embedded as a snapshot through Oct 2026. It does not update live; a new month needs a fresh pull and a republish. These are POS figures, not audited financials.

Dashboard part	OMG tool	Granularity	Coverage
Overview: net sales, gross sales, transactions, guests	`sales_summary` (per branch, per month)	162 branches × 46 months	Jan 2023 – Oct 2026
Overview: branch attributes (area, region, province, city, opening date, status)	`list_branches`	per branch	current branch list
Overview: dine-in vs take-out and category mix	`item_sales` (by category) and `sales_by_type`	network, per channel	Oct 2026 vs Oct 2025 (fixed)
PMIX: revenue and quantity per category	`item_sales` (by category, daily/monthly)	16 cells of region × area × store type	Jan 2025 – Oct 2026
PMIX: store-days (denominator of ADS, ADQS, URD)	`sales_summary` (by day)	per cell, per day	Jan 2025 – Oct 2026
PMIX: product table and product movers	`item_sales` (by item, weekly top 100)	all stores, per item	Jan 2025 – Oct 2026

Definitions used

- **Net sales**: POS net sales including service charge, as in the company's Sales Breakdown report.
- **Merchandise sales (PMIX)**: item price × quantity before discounts and service charge (`line_revenue`). It therefore runs below net sales on the Overview.
- **Store-day**: one branch that traded on one day. ADS, ADQS and URD divide by store-days.
- All amounts are in PHP. Business dates are Asia/Manila.

2. Overview: filters and shared rules

Every card on the Overview follows the same filters. Only branches that pass the filters are used in each computation.

Filter	How it works
Year	The current year (2023–2026). The default comparison is the previous year.
Months (from → to)	The months being measured. The same months are used in every year being compared.
Compare with	One or more years (multi-select) compared against the selected Year. The first one listed drives the bridge, comp flags and insights.
Quick range	Full, Last 3M, Last month.
Store type	Cafe, Kiosk or Head Office.
Comps	COMP or NON-COMP, per the rule below.
Area, Region	From the branch record in `list_branches`.
More filters	Status, Province, City, Branch.

Comp rule. A branch is COMP when its opening date is on or before the end of the period's last month, minus 13 months. Example: for Jan–Oct 2026 the cutoff is Sep 30, 2025, so any branch opened by then is comp. The rule is dynamic: the tagging changes when you change the period or Year. NON-COMP means younger than 13 months or closed.

Growth. Every growth % is `current / compare − 1`, for the same months and the same set of branches. When the compare value is 0, it shows n/a.

3. Overview: how each card is computed

All figures use the filtered branches, the selected months and the first comparison year ("LY" below). Source for every card is the branch-by-month POS cube from `sales_summary`, unless stated otherwise.

Card	What it shows	How it is computed
Net sales	Total net sales for the period	Sum of monthly net sales of filtered branches, selected months. Chip = growth vs LY. Small lines show growth vs the other compared years. Sparkline = monthly series of the selected year.
Gross sales	Sales before discounts	Same as Net sales, using gross sales.
Transactions	Number of receipts	Sum of monthly transactions.
Covers (guests)	Guests served	Sum of monthly guest counts.
Avg ticket	Net sales per receipt	Net sales ÷ transactions, for the same months.
Selling branches	Branches that traded	Count of filtered branches with net sales > 0 in the period.

Card	What it shows	How it is computed
Net sales trend and outlook	Monthly net sales per year	One line per selected year; the shaded band marks the selected months. For 2026, Nov–Dec is projected (see Foresight). The y-axis does not start at zero.
Foresight: full-year 2026 outlook	Projected FY2026 net sales	Actual Jan–Oct 2026 + projected Nov and Dec. Compared with actual FY2025. Always 2026, for the filtered branches.
Foresight method	How Nov–Dec is projected	Comparable branches: year-over-year growth = 60% × last-3-months growth + 40% × YTD growth, applied to Nov–Dec 2025. New branches: recent run-rate × a seasonal index from older branches. Closed branches are excluded. The range is an 80% band from the spread of monthly YoY growth (1.28 × standard deviation).
FY growth target tracker	Whether the year is on pace	Target = FY2025 net sales × (1 + target %). Default target is +5% and can be edited. Status: On track when the projection is at least 100% of target, At risk at 98.5% or more, otherwise Behind. Also shows the gap and the growth Nov–Dec must achieve.
Covers	Guests per month	Monthly guest counts, selected year vs compared years.
Net sales bridge	LY to current year	LY net sales, then SSSG (change in comp branches), then NSSG (change in non-comp branches: new and closed), then current net sales.
What the data says	Auto-written insights	Rules over the numbers: headline growth; ticket-led or traffic-led (compares the size of the transaction change and the average-ticket change); best and worst area or region; count of comp branches more than 5% below LY over the last 3 months; Dec 2026 forecast.
Sources of growth: historical	Previous full year built up from its base	Base year = year before. Same-store baseline = base-year sales of comp branches (Cafe and Kiosk shown separately). Same-store growth = their change. New-store sales = full current-year sales of non-comp branches. Bars add up to total net sales. Always full-year, two years back from the selected Year.

Card	What it shows	How it is computed
Sources of growth: tracking	Selected period built up from LY	Same logic for the selected months vs the first comparison year. Innovation = estimated sales of products that had zero sales in the base period (from PMIX item data, 2026 vs 2025 only, scaled to the filtered share of network sales), taken out of same-store growth so nothing is counted twice.
Sales by region	Share of net sales	Net sales of the selected period grouped by region; chip = growth vs LY.
Area performance	Bars by area	Selected year vs LY net sales per area, with growth.
Dine-in vs take-out	Share of sales by dine type	Network mix for the chosen store types, Oct 2026 only. Not affected by year, area or branch filters. Source: `sales_by_type`.
Product mix (PMIX)	Top categories by share	Category revenue share, Oct 2026 vs Oct 2025, for the chosen store types. Source: `item_sales` by category. Follows Store type only.
PMIX sales contribution	Group share	Categories rolled up to Hot foods, Cakes and bakery, Beverages, Delivery (GrabFood) and Other; change vs Oct 2025 in percentage points.
Branch league and watchlist	Branch table	Per branch: net sales, LY, growth, change in pesos, average ticket (net ÷ transactions), last-3-month growth vs LY and a monthly trend. Flags: Watch = comp, last-3-month growth below −5% and LY base of at least ₱3M; Star = comp with growth above +10%; New = non-comp with no sales in the base period; Closed = branch no longer open.

4. PMIX tab: filters and how each card is computed

The PMIX tab always compares 2026 with 2025 (item data starts in Jan 2025). Filters: Months, Quick range, Store type, Region and Area. They apply to every card below except the product table and product movers, which always cover all stores because item sales are not split by area in the source. Comps, Status, Province, City and Branch are Overview-only.

Product groups. Beverages (BV) = the BEVERAGES category. Hot foods (HF) = All-Day Breakfast, Flavorful Pastas, Fresh Salads, Perfect Plates, Mains, Soups, Pizzas, Savory Starters, Hearty Sandwiches, Kids Menu, Family Platters. Other (OT) = GrabFood plus add-ons and non-food (extras, bags, candles, samplers, etc.). Baked goods (BG) = every remaining category: cakes, pastries, ensaymada, cheese rolls, dessert bars and the kiosk cake flavors.

Metrics.

- **Merchandise sales** = item revenue summed over the selected months, filtered cells.
- **Store-days** = sum over days of the number of branches that traded.
- **ADS** = merchandise sales ÷ store-days.
- **ADQS and URD** = units sold ÷ store-days, counting only BG, HF and BV units. Add-on and non-food units are excluded because they are free or near-free items. URD is the same measure shown month by month.
- **Avg price per unit** = merchandise sales of BG, HF and BV ÷ their units.

Card	How it is computed
Running sales, ADS, ADQS, Avg price per unit	The metrics above for the selected months in 2026, with growth vs the same months of 2025 and the LY value shown beside the chip.
Group cards (BG, HF, BV, Other)	Per group: sales and growth vs LY; ADQS growth (units per store-day, not shown for Other); ADS per store; share of total sales and the change in share in percentage points.
What moved the numbers	Three auto-written lines. Growth driver = the group with the largest absolute peso change. Volume vs price = compares the growth of units per store-day with the growth of price per unit and calls growth volume-led or price/mix-led. Category movers = biggest gaining and biggest declining category, and the largest mix shift.
Sales trend	Monthly merchandise sales, 2026 vs 2025 (2025 shown for the full year). The shaded band is the selected period.
URD trend	Monthly units per store-day, 2026 vs 2025, switchable by group.
Contribution to growth	Waterfall: LY sales, then the peso change of each group (BG, HF, BV, Other), then current sales. Percentages under the bars are each change as a share of LY sales. The axis is truncated.
PMIX sales contribution %	Stacked bars of each group's share of merchandise sales, 2026 vs 2025, plus the mix shift in percentage points.
Volume vs price/mix	Per group: volume effect = (units now − units LY) × LY price per unit. Price/mix effect = total peso change minus volume effect. It includes price

Card	How it is computed
	increases and a shift toward higher or lower priced items.
Category gainers and decliners	Peso change in revenue per category vs LY: top 6 gainers and up to 5 decliners.
Foresight: Nov–Dec	For each group: Nov–Dec 2025 sales × (1 + the group's growth over the last 3 selected months). FY2026 outlook = actual Jan–Oct 2026 + projected Nov–Dec, compared with FY2025. A trend extrapolation, not a budget.
Product movers	Items ranked by peso change vs LY (gainers, decliners). Items with no sales in 2025 are listed as New or re-entered. All stores.
Product table	Per product: sales, % of total (product sales ÷ total merchandise sales of all stores), LY sales, increase or decrease in pesos and percent, units and units growth. Sortable, searchable and filterable by group. All stores.

5. Limitations and caveats

- **Snapshot, not live.** Data runs through Oct 2026. New months need a new pull and a republished dashboard.
- **Pre-2024 comparisons are less exact.** Some branches used older POS systems (Aloha to June 2023, Edesia to Dec 2023) that computed net sales differently.
- **Merchandise sales are not net sales.** PMIX figures are before discounts and service charge, so they are lower than Overview net sales and should not be mixed with them.
- **Product table is incomplete at the tail.** Item data comes from each week's top 100 items, so small products are missing. Renamed or re-coded items can appear as New or as decliners. Category figures are complete.
- **Product table and movers ignore area filters.** Item sales are not split by area in the source, so they always show all stores.
- **Estimates are not actuals.** The Foresight outlooks (Overview and PMIX) and the Innovation bar are statistical estimates, not budgets or reported results.
- **Two small cells have no 2026 data.** CAR / North / Kiosk stops after Aug 2025 and Region 4-A / Makati-Fort-Ortigas / Kiosk closed in 2023.
- **Fixed views.** Dine-in vs take-out and the Overview category mix are fixed to Oct 2026 vs Oct 2025.
- **Not audited.** All figures are POS data from OMG.
